Selection Guide con't

Application Sensors

ŝ	Sensor Type	Series	Page	Appearance	Advantages	Considerations	
0		S65	188	NEW Management	 High chromatic sensitivity to distinguish slight shade differences Chromatic and C+I intensity can be set for each color Ideal for high speed automatic packaging machines 	 3-channel color sensor C and C+I function with 10 settings White light and RGB receiver 3 independent outputs 	
	Color	SA1J SA1J-F	192		 Use to detect registration marks (regardless of similarity of color) at high speed (0.3ms) Use to distinguish between different shades of the same color 3 LEDs (red, green and blue) provide a long life—no need to replace lamps Use in wash-down environments Use when long-distance range, high speed and small sensing spots are required for color sensing applications 	 Use the 3-color sensor for multiple outputs for sorting applications Use the small spot version to detect small objects Replace conventional contrast sensors with the SA1J for reliable color sensing Use the auto-select mode to sort objects, to differentiate fine shades of the same color, or to detect objects moving to and from the sensor 	
	Contrast	TL46	198	NEW CONTRACTOR	 Automatic, manual and remote settings Wide spectrum RGB LED emissions Fast switching frequencies 	 Precision light spot with RGB LEDs NPN and PNP outputs 1 - 5.5V analog outputs Bargraph and 4-digit display options 	
rower auptres	Luminescense	LD46	202	NEW Care	 High sensitivity on fluorescent marks 10 - 100mm detection distance NPN - PNP digital output, 0 - 5V analog output High power LED UV light source 	 Can detect thin marks on even highly reflective objects Luminescent marks at longer distances can be detected Special model for detection of labels on glass Can detect marks on irregular surfaces such as wood 	
GIISUIS	Fork/Slot	SR21	206	NEW	 High speed 25kHz switching frequencies Detecting semi-transparent labels Detecting registration marks on transparent material 	 2mm slot width 20µ sec response time 	

Sensor Type	Series	Page	Appearance	Advantages	Considerations
	S80	209	NEW Catalogue Ca	 Time-of-flight technology Ideal for precise measurement of distance Use to detect position presence of large objects from a distance 	 Class 2 laser emission Direct proximity measurement 7m PNP - NPN, 4 - 20mA output RS485 serial interface
Distance	SA1D	213		 The most reliable distance sensing, calculated using optical triangle between two points and the sensor Analog output and digital output 	 Maximum analog output value corresponds to mini- mum sensing distance and minimum analog value corresponds to maximum distance
	MX1C	216		 Use in the most precise sensor applications, because of the minute size of the laser beam Use to achieve precise positioning or alignment, visible beam is easy to aim Analog and digital output 	IMPORTANT: Always consider safety when using laser sensors. Make sure laser beam cannot inadvertently shine into the eyes of people passing by or working in the vicinity. See safety information on page 232.
Area/ Dimensional	AS1	220		 Short response time is great for conveyor and material handling applications Ideal for feeding and downloading lines to count objects in random positions 	 Area sensor with crossed beams Operating distance is 2.1m 0.2mm minimum detectable thickness
	DS1	224		 Position and dimension measurement 150mm 5mm resolution, 1ms response time Operating distance up to 2.1m 0 - 10V analog output, PNP digital output available 	 PNP out activated when beam is interrupted 0 - 10V analog out proportional to dimension of object Low response time of 1 - 3msec depending on distance dimension
Magnetic Proximity	DPRI	227	TOA.	 Lightweight, compact design reduces mounting space requirements Sealed reed contact Long life and high reliability 	• Operating distance: 0 to 4mm

Universal Sensors

Tubular: S51 Series

M18 Photoelectric Sensors

- Flat plastic housing
- Cable or M12 connection with NPN or PNP output
- Standard 3-wire connection configuration
- · Selectable dark or light output

The S51 series offers a cost-effective solution in M18 photoelectric sensors, with a wide range of operating distances.

The diffuse proximity model has a 10cm fixed operating distance with a wide emission spectrum. Also available is a version with a 1 - 40cm adjustable operating distance.

Standard retro-reflective models have an operating distance up to 4m while the polarized retro-reflective models, used for reliable detection of reflective objects, are fitted with a sensitivity adjustment and have a 3.5m operating distance. The emitter and receiver models, used for longer operating distances, reach 18 meters.

The S51 series sensors, with cable or M12 connector and PNP or NPN output, provide a 3-wire connection configuration in compliance with the EN60947-5-2 standard. The normally open output is activated in light mode in proximity models and in dark mode in retro-reflective models. The output mode can be inverted using the dark/light selection input wire provided, making these extremely versatile sensors.

Compact: S60 Series

Multifunction Optoelectronic Sensors

- Long operating distance
- Sensitivity adjustment
- Independent NO-NC outputs
- M12 connection with standard NPN or PNP configuration

The S60 sensors have a sensitivity adjustment that provides quick and precise setting of the switching threshold. These sensors also have an M12 connection that can be used straight or rotated to a right-angle position. All versions have NPN or PNP outputs and standard configurations conforming to the EN60947-5-2 standard.

Through-beam Sensor with Infrared Emission - 20m

A detection system with separate emitter and receiver units, allows the user to reach larger operating distances. The sensitivity adjustment, present on the receiver, allows adjustments enabling the sensor to detect objects that block, even partially, the light emission. The IR emission is modulated to avoid interference with other light sources and can be turned off to test the sensor even without an object to detect.

Polarized Retro-reflective Sensor with Red Emission - 8m

With retro-reflective sensors, the object is detected when it interrupts the light beam generated between the sensor and its associated reflector. High-polarization optic filters also allow reliable detection of very shiny objects, such as mirrored surfaces.

Coaxial Polarized Retro-reflective Sensor for Transparent Objects - 2m

The high sensitivity and reduced hysterisis of this retro-reflective sensor allows detection of the slightest light emission, even through transparent objects, such as glass, PET bottles or plastic film sheets for packaging. The use of polarization filters helps to avoid inaccurate switching on shiny surfaces and coaxial optics improve the detection precision of the entire operating range.

Operating Distance

Detection Diagrams

Long Diffuse Proximity - 200cm

This model of diffuse proximity sensor offers a long operating distance for direct detection of objects without the use of separate reflectors or receivers. The detection distance can be set using the sensitivity adjustment. The green stability LED indicates that the received signal is higher than the minimum signal for output switching.

Output status and stability LEDs

Technological Advantages

The S60 series establishes a new standard in compact 50 x 50mm photoelectric sensors, offering a complete family of optical functions within a 15mm housing width.

SMT Chip-size for Electronic Miniaturization Gains More Space for the Optics

Coaxial Optics

The standard dimensions, reduced housing width, and the multi-hole mounting system make the S60 series superior to the majority of compact sensors present on the market.

The models are available with M12 connectors, NPN or PNP output, and conform to EN60947-5-2 European standards.

The M12 connector can be easily rotated to 90° and can be locked in straight or right-angle positions compared to the optic axis. The cable emerges at 45° and can be bent almost 360° . These characteristics allow the sensor to be easily mounted on any side and at any angle.

The S60 series are available in through-beam, polarized retro-reflective and diffuse proximity. The polarized retro-reflective model is available with a coaxial optic version with the emitter optic axis coinciding with the receiver. This offers superior detection axis precision and eliminates the blind zone near the sensor.

Compact Photoelectric Sensors

Coaxial optics are also available in the polarized retro-reflective model for detection of transparent objects. This increases the performance of the optical function and its immunity to object movement inside the detection area.

The range and switching threshold output can be selected from 50 - 150mm, with a \pm 1mm precision; direct or inverse proportionality and light or dark operating modes can also be selected.

Complete External Shield for High Electromagnetic Compatibility

Compact: S62 Series

High-performance Sensors

Class 2

Class 2

- High-resolution sensors with LED or Laser emission
- Background suppression models ranging from 30 350mm
- Polarized retro-reflective with operating distances up to .3 20m
- Sturdy ABS housing with compact 18 x 50 x 50mm dimensions
- NPN or PNP double output with standard NO-NC configuration

The S62 series, in a 18 x 50 x 50mm compact plastic housing, offers maximum performance for industrial automation applications.

The background suppression proximity models can detect up to 300mm using visible red LED emission, or up to 2000mm with infrared emission. The operating distance can be adjusted through a precise multiturn mechanical regulation of optical triangulation to obtain maximum immunity against color differences of the detected object or of the background, even if very reflective.

A visible red laser is available with a 50-350mm background suppression distance and a polarized retroreflective range reaching more than 20m.

These Laser sensors are characterized by a very small light spot, as well as a fast response time for excellent detection repeatability, even of very small objects or movement.

The background suppression proximity sensor can be set precisely over the limit that the object is not detected, even with subtle differences between objects with material or color variances.

Threshold switching adjustment is easy and more precise due to the multi-turn mechanical sensitivity adjustment and numerical scale.

The polarized retro-reflective model detects very shiny objects even with mirrored surfaces.

18

Indicators & Settings

For information on accessories, see page 171.

Emission Type

The ability of background suppression sensors to detect very small variances in contrast (between light and dark areas) allows detection of the presence or absence of a dark-colored target, even on a light-colored, very reflective background. However, if the target is much smaller than the light spot or smaller than the background area, detection can be difficult because of either low resolution or a "cross-eyed" effect (excessive light reflected by the background).

The narrow light beam of the S62 Laser background suppression sensor is the right solution for good resolution and to avoid a "cross-eyed" effect. It can detect the smallest objects or their minimal movements, even with large and/or reflective background areas.

The Laser polarized retro-reflective sensor of the S62 series, as well as increasing maximum operating distance, offers improved detection resolution due to smaller dimensions of the light beam with respect to the LED emission beam.

The minimum detectable dimension corresponds to the emission beam diameter at the detection distance. Using reflectors (0.8mm microcubes) will help to achieve maximum resolution. For example, the R8 is suitable for short distances up to 2m, while the R7 or R20 models are for distances up to 22m.

Miniature Photoelectric: SA1E

Simple, Compact Design for Worldwide Usage

- Six sensing methods
- 1m proximity, 15cm with narrow beam
- 4m polarized retro-reflective
- 15m through-beam
- Standard 3 wire output configuration
- Cable and M8 connector types available
- NPN output, PNP output, Light On, Dark On options
- Long sensing ranges, high-speed response
- CE marked, UL Listed

Ensuring the accurate recognition of target objects is critical for many control systems. Reliable object recognition means fewer false alarms, increased productivity and less product rejection. When selecting sensors for your applications, the most important criteria to consider are: reliability, durability and rug-gedness.

The miniature SA1E photoelectric sensors incorporate all of these features in a compact housing, and are also easy-to-install and competitively priced. All SA1E photoelectric sensors are IP67 rated, UL/c-UL listed and CE marked. A choice of NPN or PNP outputs are available, as well as a choice of Dark ON or Light ON operation modes.

Dimensions (mm)

Connector Models

Note 1: Stable LED is not provided on the background suppression type.

Note 2: The connector length is 18mm when a right-angle connector cable (SA9Z-CM8K-4L*) is attached.

Fiber Optic Analog: SA1C-FK

- High-speed, miniature photoelectric sensors with analog (4 20mA) and digital output
- Senses gradual color changes
- Available in both red and green LEDs
- Through-beam and reflected-light sensing available
- Ideal for either color mark applications or simple presence and absence applications requiring analog output
- Compact size allows for DIN rail mounting
- Fiber optic units available to address specific application needs
- Simple to install
- IP66 protection rating

Built on the foundation of SA1C-F, SA1C-FK is ideal for either color mark applications or simple presence and absence applications requiring analog output.

Featuring analog and digital output, this sensor comes in through-beam or reflected-light sensing styles.

Dimensions (mm)

Specifications

Panel Mounting Bracket (attachment)

Mounting Hole Layout

(when using a panel mounting bracket)

		SA1C-FK3	SA1C-FK3G
Light Source Floment	Red LED	\checkmark	-
Light Source Liement	Green LED	-	
Sensing Distance	Depends on the fiber unit (see page 173)	\checkmark	
Power Voltage	12 to 24V DC (Operating voltage: 10 to 30V DC) ripple 10% maximum	\checkmark	\checkmark
Current Draw	80mA maximum	\checkmark	
Analog Current Output	4 to 20mA, 5V DC maximum ¹	\checkmark	
Digital Output	NPN open collector 30V DC, 100mA maximum,1.5V maximum with short circuit protection	\checkmark	\checkmark
Operation Mode	Dark ON (connect MODE line to GND line) Light ON (connect MODE line to power line)	\checkmark	\checkmark
Response	0.5ms maximum ²	\checkmark	
Indicator	Operation LED: Red, Stable LED: Green	\checkmark	\checkmark
Detectable Object	Translucent object, opaque object	\checkmark	\checkmark
Hysteresis	20% maximum (using reflex fiber unit)	\checkmark	\checkmark
Sensitivity	4-turn adjustment	\checkmark	\checkmark
Operation Point Control	1 turn	\checkmark	\checkmark
Receiver Element	Photo diode	\checkmark	\checkmark
Operating Temperature	-25 to +55 $^\circ\text{C}$ (performance will be adversely affected if the sensor becomes coated with ice)	\checkmark	\checkmark
Storage Temperature	-30 to $+70^{\circ}$ C (performance will be adversely affected if the sensor becomes coated with ice)	\checkmark	\checkmark
Operating Humidity	35 to 85% RH (avoid condensation)	\checkmark	\checkmark
Extraneous Light Immunity	Sunlight: 10,000 lux maximum; Incandescent light: 3,000 lux (at the receiver)	\checkmark	\checkmark
Noise Resistance	Normal mode: 500V (50ns to 1 μ s, 100Hz: Using a noise simulator) Common mode: 300V (50ns to 1 μ s, 100Hz: Using a noise simulator)	\checkmark	\checkmark
Insulation Resistance	Between live and dead parts: 20M Ω minimum, with 500V DC megger	\checkmark	\checkmark
Dielectric Strength	Between live and dead parts: 1,000V, 1 minute	\checkmark	\checkmark
Vibration Resistance	Damage limits: 10 to 55Hz; Single amplitude: 0.75mm 20 cycles in each of 3 axes	\checkmark	
Shock Resistance	Damage limits: 500 m/sec ² 10 cycles in each of 3 axes	\checkmark	\checkmark
Degree of Protection	IP66—IEC Pub 529	\checkmark	
Cable	Cable type: Ø4.4mm 5-core vinyl cabtyre cable 0.2mm2, 6'-6-3/4" (2m) long	\checkmark	\checkmark
Material	Housing: PBT	\checkmark	\checkmark
Accessories	Mounting bracket, adjusting screwdriver, load resistor (249 Ω) for converting analog amperage to voltage (1 to 5V)	\checkmark	\checkmark
Interference Prevention	Up to 2 units can be installed in close proximity. For analog output, interference prevention is not possible.	\checkmark	\checkmark
Weight	Approximately 75g	\checkmark	

Analog current output specification is based on the power voltage range from 12 to 24V DC (±10%).

1. Use the attached resistor (249Ω, 1/4W) as a load resistance for converting analog output to voltage.

2. Response time for analog current output is between 10% and 90% of the rise or fall of the voltage signal when using a 249Ω resistor.

High-speed Fiber Optic: SA1C-F

- Ideal for remote sensing applications
- Featuring quick-connect cable and easy-insert fiber optic units for simple installation
- Through-beam and reflected-light sensing available
- Sensing range up to 7.09" (180mm) for throughbeam sensors
- Dual outputs: Select NPN and PNP transistor outputs or NPN transistor output combined with a self-diagnostic output
- Outputs selectable for light on or dark on
- High-speed, 50µs response time
- Featuring variable off-delay (0 to 100msec) and finetune sensitivity adjustment
- Stable LED makes alignment easy
- Red or green LEDs available for detecting color marks
- Mount on a 35mm DIN rail

The perfect fiber optic sensor for applications where you have difficulty mounting regular or miniature sensors or where accessability is a problem.

Available in through-beam and retro-reflective models, the built-in variable off-delay (0 - 10ms) can help you bring your complete system in tune.

The 50µs response time ensures detection of fast moving targets in a high-speed manufacturing environment where speed counts.

Dimensions (mm)

Specifications

		SA1C-FN, -FD (Standard Speed)	SA1C-F1N, -F1D (High-speed)
Power Voltage	12V to 24V DC		\checkmark
Operating Voltage	10V to 30V DC, ripple 10% (maximum)		
Current Drow	30mA (maximum)	\checkmark	-
Current Draw	40mA (maximum)	_	\checkmark
Operating Temperature	Amplifier only: -25° to +55°C Fiber optic cords (except heat-resistant types): -40° to +70°C Heat-resistant fiber optic cords: -40°C to +350°C (avoid ice coating)	\checkmark	\checkmark
Operating Humidity	35 to 85% RH (avoid condensation)		\checkmark
Extraneous Light Immunity	Sunlight: 10,000 lux (maximum); Incandescent light: 3,000 lux (maximum) on receiver surface— defined as incident or unwanted light received by a sensor, unrelated to the presence or absence of the intended object	\checkmark	\checkmark
Material	Amplifier only: PBT resin (housing) with polycarbonate lens Fiber optic cords (except heat-resistant types): Nickel-plated brass (sensing head), polyethylene-covered PMMA (cord), and SUS304 stainless (sleeve) Heat-resistant fiber optic cords: SUS 304 stainless (sensing head) and SUS spiral tube around glass fiber cord	V	\checkmark
Degree of Protection	IP66 — IEC Pub 529, sensors rated IP66 are dust-tight, water-resistant, and perform best when not subjected to heavy particle or water blasts	\checkmark	\checkmark
Cable	Cable type: 0.2mm2; Vinyl cabtyre cable #24 AWG, 6'-6-3/4' (2m) long Connector type: Ø 0.31" (8mm) 3- or 4-pin connector (cable ordered separately for quick connect sensors)	\checkmark	\checkmark
Light Source	Red or green LED (pulse-modulated)	\checkmark	\checkmark
Output	NPN transistor: 30V DC (1.2V residual), 100mA (maximum) PNP transistor: 30V DC (2.0V residual), 200mA (maximum) Self-diagnostic: 30V DC (1.2V residual), 50mA (maximum)	\checkmark	\checkmark
Pagnanga	0.5ms (maximum)	\checkmark	-
nesponse	50µs (maximum)	-	\checkmark
Off Delay	0 to 100 ms (adjustable)	\checkmark	\checkmark
Sensitivity	4-turn adjustment		\checkmark
Minimum Bending Radius	Fiber optic cord (except SA9F-TT, -DT, -TL, and -DL): 1"R (25mm); Sleeve: 0.39"R (10mm) SA9F-TT and -DT: 0.59"R (15mm); Sleeve: 0.39"R (10mm) SA9F-TL and DL: 0.59"R (15mm); Sleeve: Unbendable	\checkmark	\checkmark

Application Sensors

Color: S65-V

Compact 50 x 50

- 3 channel color sensor with C or C+I functions and 10 tolerance levels
- White light LED emission and RGB photoreceiver
- 3 independent NPN or PNP outputs and RS485 serial interface
- 2 push-button easy setting and 4-digit display

The S65-V color sensor offers the best performance for color detection in a standard 50 x 50 x 25mm housing.

The sensor can memorize and recognize 3 colors on 3 independent channels. C (chromaticity) or C+I (chromaticity and intensity) detection algorithm and tolerance levels can be selected for each color.

Additional functions include keylock and synchronization with external events through a specific input. The control panel has two push-buttons for setting the sensor, LED outputs and a 4-digit display for messages and sensor configuration.

The S65-V color sensor can be configured in either 'C' or 'C+I' detection modes. The 'C' mode is used to obtain a larger depth of field, or to detect colors on different opaque, shiny or reflecting surfaces. The 'C+I' mode offers higher sensitivity towards tone variations, and is recommended for detection of different colors on the same material. It will also distinguish gray tones.

Color: SA1J/SA1J-F

Full Color Sensors

- Choice of a 3-color version or a 1-color version
- Fast response (0.3ms)—perfect for sensing complex color marks at high speed
- Three LEDs (Red, Green, and Blue) provide a long life
- Set sensor with the touch of a button
- Highly sensitive to variations in color; can distinguish between subtle shades of the same color
- IP67

SA1J:

- Easy alignment and targeting using a visible spot
- Up to 60mm sensing distance

SA1J-F

• Wide assortment of fiber optic heads fit in tight mounting areas

The SA1J series of sensors are a proven leader among inexpensive color recognition sensors. With a high response speed of 0.3msec and superb color discriminating electronics, the SA1J full color sensor is the perfect solution for almost any color detection application.

This full color sensor is simple to program. You literally just touch a button and your target reference color is programmed. With the SA1J's small visible beam spot, this sensor is easy to align in complex applications.

The SA1J is available in 1- or 3-color models. The SA1J 3-color sensor offers users the added benefit of three reference color registration and three individual outputs. This is ideal for multiple color registration.

The SA1J-F is also ideal for color sorting and quality control applications where space is limited. The SA1J-F can utilize a wide assortment of fiber optic heads to fit in the smallest of mounting areas. The SA1J-F offers both one and three color programmable sensors for multiple-color sorting applications. With the touch of a button, the SA1J-F is programmed and ready to take on difficult applications.

A cost-effective solution for full color sensing applications—IDEC's SA1J full color recognition sensor. Outstanding benefits of the SA1J include an extremely high response speed (0.3ms) and high resolution.

Each channel has its own independent short circuit protection.
 *The target color is defined by the operation mode setting.

This line of full color sensors offers IDEC's proven color sensing technology in a fiber optic version. The SA1J-F is ideal for color sorting and quality control applications where space is limited. The SA1J-F utilizes a wide assortment of fiber optic heads to fit in the smallest of mounting areas. This product line offers both 1- and 3-color programmable sensors for multiple color sorting applications. With the touch of a button, the SA1J-F is programmed and ready to work. The SA1J-F also has a remote lead for programming by a remote PLC or switch.

Contrast: TL46

Digital Contrast Sensor with Metal Housing

The TL46 digital contrast sensor is characterized in terms of resolution, definition and precision of the

The TL46 digital contrast sensor is characterized in terms of resolution, definition and precision of the light spot emitted by RGB LEDs, fast response time and high switching speed. The sensor, developed in a sturdy metal housing with standard mounting, is available for applications requiring innovative technology at the best price/performance ratio.

The TL46-WL has 3 push-buttons to set the sensor, 4 LEDs signaling the output status, sensor acquisition condition, delay output activation and push-button activation. A bar graph is also available for manual setting of the threshold to detect particularly difficult contrasts. It also has a 20kHz switching frequency.

Accessory lenses with 9 - 40mm focal distance are available, as well as a high-resolution focusing lens and a PMMA plastic lens particularly suitable for food applications with standard 9mm focal distance.
Setting

The switching threshold is set by pressing twice on the SET button; the first for the mark, the second for the background. The threshold level can also be set manually by pressing the '+' and '-' buttons, which increase or reduce the threshold as shown on the bar graph or display.

Power Supplies

Luminescence: LD46

UV LED Emission Sensors

- UV luminescent mark detection
- High-powered UV emission for improved sensitivity
- Fast switching frequency and response time
- Easy setting with a clear bar graph indicator

Luminescence sensors emit ultraviolet (UV) light and receive visible light reflected from luminescent surfaces. This technology allows the detection of fluorescent marks (even invisible to the human eye) on any object independent of its material, color or distance, inside the operating range. In addition, it ignores light interference or reflections from non-luminescent surfaces, like glass, mirrors or shiny metal surfaces.

Luminescence sensors can be utilized in many different applications., For example, in pharmaceutical and cosmetic industries they can detect labels on glass vials or bottles, or verify packaging. They can be used to check fluorescent selection marks in woodworking and ceramic tile production; detect whitened paper or fluorescent glues in automatic packaging, and identify fluorescent cutting guides or labels in textile industries. In addition, they can be used to verify fluorescent paints, lubricants, gaskets or fittings in mechanical industries; or check money and credit cards in vending machines or cash dispensers. The high power and shape of the LD46 sensor light spot enable the detection of critical targets with a very poor, non-homogeneous or low luminescent light level, such as raw wood, corrugated cartons, fabric or ceramic tiles.

Communication & Networking

The switching threshold can easily be set by pressing the '+' and '-' buttons that increase or decrease the sensitivity level that can be seen on the bar graph indicator. The sensor has a KEYLOCK function that deactivates the keyboard preventing accidental sensor setting. The keyboard is locked when the sensor is turned on and can be activated by pressing the SET button for 5 seconds until the keylock LED turns on. The keyboard automatically locks again if not used for 2 minutes.

Fork/Slot: SR21

Micro-processor Based Slot Sensors For Labeling & Packaging

- High 25kHz switching frequency
- Red/green light models
- Detection of semi-transparent labels
- Detection of registration marks on semitransparent labels
- 4-wire independent NPN and PNP output

The SR21 series slot sensors, with a 2mm slot width, provide a 12-bit (4096 step) resolution, a $20\mu s$ response time and a switching frequency of 25 kHz.

The setting of the switching threshold is carried-out by simply pressing a button, or dynamically during label (or other reference) movement.

The SR21-RG model with double red or green light is ideal for print registration mark detection on transparent films for automatic packaging.

Sensors

Distance: S80

Laser Distance Sensor with Time-of-Flight Measurement

- High precision and speed
- Measurement range adjustable to 7m
- 4-digit display and RS485 serial interface

The S80 series, in a compact sturdy metal housing, offers an innovative class 2 laser distance sensor with time-of-flight measurement. This technology, based on the measurement of the time between the emission and receipt of the laser light pulses, ensures accurate distance detection.

The sensors function from 0.3 to 7m, within an adjustable range, in positioning or detection applications, such as double-threshold background suppression over long distances.

All models have two outputs, available in both the NPN and PNP models, that can be set at different distances. While the measurement value is a 4-20mA analog output and RS485 serial interface; the latter can also be used to set all the sensor parameters.

In addition, the S80 series offers the option to adjust the 4-20mA analog output. This feature allows the minimum and maximum values of the operating distance to be set and linked to the minimum and maximum current.

A 4-digit display shows the distance, as well as the parameters that can be set using the three buttons.

Laser distance sensors with time-of-flight measurement are suitable for long distance measurements offering constant performance along the entire range. Resolution represents the minimum dimension, or the smallest target detected by the sensor.

Linearity indicates the maximum deviation of the analog output with respect to the ideal value and is expressed as a percentage of the full range.

Temperature drift indicates the maximum deviation in relation to variations in the sensor temperature and is expressed in mm/ $^{\circ}$ C.

Finally, repeatability represents the variation of the measurement made different times on a target at the same distance.

Distance: SA1D

Analog Distance Detection Sensors

- Triangulation ensures high-precision when sensing the presence or position of objects
- Wide sensing range: 7.87" to 19.69" (200 to 500mm)

- Far and near limits can be defined for detecting objects within a specified zone
- A ten-dot LED level meter provides a dynamic display of detected positions and also shows near and far settings
- Alarm output indicates when sensing conditions may result in inaccurate results

SA1D sensor provides versatile, accurate distance sensing for your specific application needs. Both in analog and digital output style for comparison.

The advantage of the SA1D is that the shape, size, material, and color do not detract from accurate measurement.

PLCs

Distance: MX1C

Self-Contained Laser Displacement Sensors

- Analog output (20 to 4mA) can be selected for continuous values; digital output (on/off) can be used; or both can be used together
- Miniature sensor head is compact for high-density installations
- Visible beam is easy to align with target

- Adjustable response speed
- Shape, size, color and material do not detract from accurate measurement (see note)
- Wide sensing range: 2.36" to 6.30" (60mm to 160mm)
- A ten-dot dynamic display shows detected positions
- Alarm output indicates when sensing conditions may result in inaccurate results

The MX1C is a self contained laser displacement sensor. Featuring a small size and high resolution of 50 microns (0.002"), the MX1C is perfect for small mounting areas with delicate applications. The MX1C is easy to align with its visible Red laser. The MX1C offers a 4-20mA analog output, and, a discrete transistor output for displacement determination.

The MX1C utilizes triangulation to determine object displacement. The sensor head projects a laser beam to the object. The diffuse-reflected light from the object's surface is received as a spot image. This spot image moves from position A to B on the PSD (position sensitive device). Optical triangle is used to compute the exact distance between the sensor and the object.

Laser sensing of mirror-like surfaces is not recommended. For best results detecting reflective surfaces, tilt the sensor to reduce direct laser reflection. Sensing at a small angle (approximately ±10°) does not significantly reduce sensing accuracy or linearity of resulting analog output.

2. WARNING: Class IIIa laser. Do not allow the laser to shine directly into the eyes. Always consider eye safety when installing a laser sensor. Make sure that the laser beam cannot inadvertently shine into the eyes of people passing by or working in the vicinity. See laser safety information on page 232.

PLCs

Installation

See page 233 for general sensor instructions. Below are considerations specific to the MX1C miniature laser sensors.

When installing multiple sensors, provide the recommended clearance as shown below, to prevent the interference of signals.

L	Α	В	С
2.36" (60mm)	0	0	0
4.33" (110mm)	0	0.79" (20mm)	1.97" (50mm)
6.30" (160mm)	0.79" (20mm)	2.36" (60mm)	3.94" (100mm)

Laser sensing of mirror-like surfaces is not recommended, as the sensor receiver is designed for detecting diffuse-reflected light. Direct laser reflection may result in unreliable results.

For best results detecting reflective surfaces, tilt the sensor to reduce direct laser reflection. Sensing at a small angle (approximately $\pm 10^{\circ}$) does not significantly reduce the sensing accuracy or linearity of the resulting analog output.

WARNING: Class Illa laser. Do not allow the laser to shine directly into the eyes. Always consider eye safety when installing a laser sensor. Make sure laser beam cannot inadvertently shine into the eyes of people passing by or working in the vicinity. See laser safety information on page 232.

Projected Beam Characteristics

Due to the focusing characteristics of the lens, the projected beam of a laser sensor gets smaller (converges) from the near end to the far end of the sensing range. The beam gets larger (diverges) beyond the far end of the sensing range.

Wiring

Wire Color	Name	Function
Brown	+V	24V DC, 200mA (maximum)
Black	OUT	Digital Output, 30V DC, 100mA
Orange	ALM	Alarm Output, 30V DC, 100mA
Blue	GND	Power Ground (0 V)
White	ANALOG	Analog Output, 20 to 4mA
Peach	LD RMT	Remote Interlock On/Off Switch
Shield	A. GND	Analog Ground

The analog output line may be extended up to 33' (10m), as long as the cable used is equal to or superior to the cable provided. Other lines may be extended up to 164' (50m), using #22 AWG (0.3mm2) wire.

- Operating distance 2.1m 0.2mm minimum detectable object thickness

• 100mm height

PNP output and Scan mode input

The photoelectric light grids of the AS1 series are crossed-beam area sensors able to detect all objects, as small as a 0.2mm thickness, inside a 100mm height, over operating distances reaching 2.1m between emitter and receiver.

AS1 area sensors are an ideal solution for detection of very small objects, even when moving and in varying positions inside a controlled height and width. The distance between emitter and receiver can range from 0.3 to 2.1m.

With their short response time, ultra-compact AS1 light grids are perfect for fast conveyor lines, such as insertion and downloading lines, and for detection and counting of objects in random positions.

The PNP output is activated every time an object is detected between the receiver and emitter.

The AS1 has a high resolution with a light array that has 16 beams to ensure accurate detection.

Selection inputs of the SCAN MODE can configure 4 different crossed-beam scanning modes. These different modes allow variances in detection performance, in particular, resolution can be increased to 0.2mm thickness, or response time to less than 3ms.

Detection & Measurement Light Grids with Analog Output

5mm resolution and 1ms response time100 to 300mm height

· Position and dimension measurement

- Operating distance up to 2.1m
- PNP digital and 0-10V analog outputs

The DS1 AREAscan[™] sensor is a compact multibeam light grid suitable for detection and measurement of objects with different shapes and sizes. DS1 is available with 100mm height, 5mm resolution and an operating distance of 2.1m.

The electronics are fully integrated and as a result, no external drivers are required. A value is supplied through the analog 0-10V output that is proportional to the number of interrupted beams.

The PNP digital output is activated every time a beam between emitter and receiver is interrupted. The response time, less than 3ms, depending on the height and measurement resolution, allows installation on the fastest machines and processes.

The measurement of the object's position or dimensions, placed inside the sensitive area, is obtained by the 0 - 10V analog output, which supplies a signal proportional to the number of interrupted beams.

The PNP digital output is activated each time the beam is interrupted by an object; in this case, the yellow OUT LED on the receiving unit panel turns on.

A green POWER ON LED, also on this panel, signals the wrong alignment between the emitting and receiving units, as well as when an object moves outside or near the maximum operating distance.

Laser Safety Information

Installation: If a sensor is installed so that the laser beam may shine or reflect into the eyes of a person passing by or working in the vicinity, place an opaque sheet of material in front of the beam to prevent potential eye injury. For people working near a laser sensor, protective glasses which screen out a significant amount of the harmful radiation are recommended at all times.

All laser sensors also include a remote interlock terminal which can be used to turn the laser on or off with an external switch, as required, to operate the sensor safely from a remote location.

To avoid exposure to harmful radiation, never disassemble a laser sensor.

WARNING: Do not allow class IIIa and IIIb laser beams to shine directly into the eyes. Do not allow lasers to reflect from a glossy, shiny, or reflective surface into the eyes.

General Information

Specifications

Do not operate a sensor under any conditions exceeding these specifications.

Do not operate a sensor under current and voltage conditions other than those for which the individual sensor is rated.

Do not exceed the recommended operating temperature and humidity. Although sensors are rated for operation below 0°C, this specification does not imply that performance characteristics will remain constant under prolonged freezing conditions. Continued exposure and the accompanying frost, ice, dew, and condensation which accumulate on the optical surface will adversely affect sensor performance.

To maintain performance characteristics, do not exceed vibration and shock resistance ratings while operating a sensor. In addition, avoid impacts to the sensor housing which are severe enough to adversely affect the waterproof characteristics.

IEC (International Electrotechnical Commission) Ratings

Sensors rated IP67 are resistant to moisture when occasionally immersed in water. Sensors rated IP64 through IP66 are resistant to moisture when occasionally subjected to splashing or when located in the vicinity of turbulent waters. These ratings do not imply that a sensor is intended for use under continual high-pressure water spray. Avoid such applications to maintain optimal sensor performance.

Sensors rated IP64 through IP67 are dust-tight and water-tight. For best performance, avoid using any sensor in an area where it will be subjected to heavy particle blasts and where dust, water, or steam will accumulate on the optical surface.

Start-up

Do not test the housing for dielectric strength and insulation resistance, since the housing is connected to the electronic circuit ground of a sensor. Do not perform dielectric strength and insulation resistance tests on electrical systems without disconnecting photoelectric sensors, as such testing may result in damage to the sensor.

Several lines of sensors, as noted in the individual operation sections, are provided with an internal circuit to turn an output off for a specified amount of time upon power-up. This delay is normal; it prevents a transient state when turning power on.

Optimum Performance

The optical surface of each sensor must be cleaned on a regular basis for continual superior performance. Use a soft cloth dipped in isopropyl alcohol to remove dust and moisture build-up.

IMPORTANT: Do not use organic solvents (such as thinner, ammonia, caustic soda, or benzene) to clean any part of a sensor.

All sensors experience signal inconsistencies under the influence of inductive noise. Do not use sensors in close proximity to transformers, large inductive motors or generators. Avoid using sensors in direct contact with sources of excessive heat. Also avoid operation in close proximity to welding equipment.

Liaht

Visible light is electromagnetic radiation with a wavelength between 390 and 770nm. White light is composed of all the visible spectrum components in equal quantity; the predominance of a specific wavelength determines the color of the light. Light Emitting Diodes (LEDs) are the most common light used in optoelectronics.

0

α

Transmission, Absorption, Reflection

When light hits an object three things take place at the same time: reflection (ρ) , absorption (α) and transmission (τ); with parameters and ratios that vary according to the object themselves, which are then further

differentiated by material, surface, thickness and/or color. These elements can be detected using a photoelectric sensor.

Extraneous Light

Bright, extraneous light such as sunlight, incandescent lights, or fluorescent lights may impair the performance of sensors in detecting color or light.

Make sure that extraneous light does not exceed recommended levels found in the individual specifications sections. When 500 lux is specified, this is equal to 50 footcandles. The average factory illumination is ordinarily below this level, except in areas where visual inspection is being performed. Only in such brightly lit areas is incident light of particular concern.

Unwanted light interference can often be avoided simply by making sure that the optical receiver is not aimed directly toward a strong light source. When mounting direction cannot be adjusted, place a light barrier between all nearby light sources and the receiver.

Through-beam Sensors

(when the light directly hits the

receiver and when the object

interrupts the beam) with the highest Excess Gain and the

up to 50m. These sensors can

operate in the harshest environ-

mental conditions, such as in the

largest operating distance reaching

With through-beam sensors, the light emitter and receiver are contained in two different housings that are mounted one in front of the other. The light beam emitted by the emitter directly hits the receiver; each object that interrupts the beam is detected. This system is used to obtain large signal differences

00

0

presence of dirt or dust. The disadvantage is that two units have to be wired (an emitter and receiver). The through-beam optic function operates typically in dark mode: the output is activated when the object interrupts the beam between the

11î ‡				
×	₹.	щ	*:	L C

It is strongly recommended to avoid using any sensor where it will be continually subjected to elements which impair performance or cause corrosive damage to the sensor. In particular, avoid strong vibrations and

emitter and receiver.

shocks, corrosive gases, oils and chemicals, as well as blasts of water, steam, dust or other particles.

Automation Software

Power Supplies

Sensors

A slit attachment is available to modify the beam size of through-beam sensors. This option is recommended for detecting very small objects (near the size of the smallest object which a sensor can detect) or for eliminating light interference when sensors are mounted in close proximity.

Retro-reflective

PLCs

Photoelectric sensors with this function contain both the emitter and

III: receiver inside the same housing. The emitted light beam is reflected on the receiver due to a prismatic reflector; an object is detected when it interrupts the beam. Compared to the through-beam optic function, the signal difference is reduced (when the light is freely reflected by the reflector and when an object

interrupts the beam) so Excess Gain is reduced and maximum operating distances can reach 12 meters. It is necessary to operate in clean environments without dirt or dust. A retro-reflective sensor typically operates in the dark mode: output is activated when an object interrupts the light beam between the sensor and reflector.

When installing sensors which detect reflected light, make sure that unwanted light reflections from nearby surfaces, such as the floor, walls, reflective machinery or stainless steel, do not reach the optical receiver.

Also, make sure that reflected-light sensors mounted in close proximity do not cause interfering reflections. When it is not possible to maintain the recommended clearance between sensors, as noted in the individual installation sections, provide light barriers between sensors.

Prismatic Reflector

A prismatic reflector is able to reflect incident light in a parallel manner, with a reflection coefficient higher than any other object for angles less than 15°. Typically the operating distance proportionally increases according to the reflector's dimensions. The reflector can rotate the incident light's polarization plane at 90°.

Polarized Retro-reflective

In presence of critical detection of objects with very reflective surfaces, 2 such as shiny metals or mirrored glass, retroreflex sensors with polarized filters have to be used. In polarized retroreflex sensors, the emission light is polarized on a vertical plane, while the reception is obtained only through a polarized filter on a horizontal plane. A prismatic reflector rotates the light plane at a right angle, while the light reflected from the object maintains polarization plane unvaried and is blocked by the filter placed on the receiver. Consequently, only the light reflected by the prismatic reflector is received.

Retro-reflective for Transparent Objects

For detection of transparent objects, such as PET bottles or Mylar sheets, a low-hysteresis retro-reflective sensor (capable of detecting small signal differences) can be used. These sensors detect small

Photoelectric sensors with this function contain both the emitter and

receiver inside the same housing. The emitted light beam is reflected

signal differences that the light undergoes when it passes through a transparent object.

Diffuse Proximity

on to the receiver directly by the object. which is detected without the need of prismatic reflectors. Proximity sensors represent the most economic and fastest mounting solution. However, they work with weaker signals compared to retro-reflective sensors. Excess Gain is reduced and

operating distance, depending on the object's reflection degree, can only reach 2 meters.

A proximity sensor normally operates

in light mode: the output is activated when an object enters the detection area and reflects light emitted by the sensor.

Background Suppression

Background suppression sensors allow the operator to precisely set the maximum detection distance. The operating distance adjustment is not

IZIX based upon the receiver's sensitivity, but is obtained through optic triangulation, mechanically acting on the lenses or photoelements angle or electronically using PSD (Position-Sensitive Detectors) receiving systems. Consequently the detection of an object is independent of other objects behind (or in the background), which are suppressed. Moreover, due to this adjustment method, all objects can be detected at the same distance independent of their color.

Distance Sensors

Distance sensors supply an analog signal of 0-10V or 4-20mA proportional to the measurement of the distance between the emitting optics and the target.

The main technologies involved are optic triangulation and time-of-flight. The first allows very precise measurements on short distances, while the second is ideal for medium and long distances.

Sensors

Operator Interfaces
Sensors

Slot Sensors

A slot sensor is a version of a through-beam retro-reflective sensor,

t where the emitter and receiver are placed opposite each other on the inside of an U-shaped housing. Any target that passes through the internal slot interrupts the beam and is detected. Due to their construction, slot sensors are great for applications with short operating distances. The most typical slot sensor applications are hole or teeth detection on gears, label detection, or edge control and continuity of sheets or tapes. The emission is generally infrared light; however visible red or green

emission versions are available and able to detect references such as registration marks, that present color contrasts on transparent film.

Contrast Sensors

Contrast sensors (also defined as color mark readers) present a proximity function but, instead of detecting only the presence or absence of an object, they are able to distinguish between two

surfaces. This accomplished by detecting the contrast produced by the different reflection degrees. In this manner a dark reference mark (low reflection) can be detected due to the contrast with a lighter surface (high reflection), or vice versa. In the presence of colored surfaces, the contrast is highlighted using an LED, typically red or

green. For general purposes a white light is used because the full light spectrum detects the majority of contrasts. White light emission is obtained through lamps, or LEDs in most sensors, enabling the detection of very slight contrasts due to different surface treatments, even of the same material and color.

Contrast sensors are mainly used in automatic packaging machines for registration mark detection to synchronize folding, cutting and welding.

Contrast on White Background			
Mark Color	Red LED	Green LED	White LED
Red	no	medium	medium
Orange	low	medium	medium
Yellow	low	low	medium
Green	high	no	medium
Blue	high	medium	high
Violet	medium	high	high
Brown	low	medium	high
Black	high	high	high
Gray	medium	medium	medium
White	no	no	yes

Luminescence Sensors

'Luminescence' is defined as visible light emission from fluorescent or phosphorous substances, due to electromagnetic radiation absorption. Luminescence sensors emit ultraviolet light, which is reflected at a

higher wavelength (minor energy) on a fluorescent surface, shifting into the visible light spectrum. Ultraviolet light emission is obtained using special lamps, or LEDs in sensors. UV emission is modulated and the visible light reception is synchronized. Maximum immunity against external interferences, such as reflections caused by very shiny surfaces, is

obtained. In addition, fluorescent targets, invisible to the human eye, can be detected. Luminescence sensors are used in various industries: detecting labels on glass or mirrors in pharmaceutical and cosmetic fields; selecting tiles marked with fluorescent marks in the ceramic industry; determining the presence of fluorescent glues on paper for automatic packaging; distinguishing cutting and sewing guides in textile manufacturing; checking fluorescent paints or lubricants in mechanical production.

The color of an object depends on all the color components of the

incident light which are being reflected, eliminating those which have

Color Sensors

been absorbed. The dominant color is defined as 'hue' and depends on the reflected light's wavelength. 'Saturation' indicates the pureness of the color with respect to white and is represented as a percentage. Hue and saturation together are defined as 'chromaticity'.

Color or chromatic sensors have a proximity function with generally three RGB LEDs for light emission. The color of

blue 100%

100%

an object is identified according to the different reflection coefficients obtained with red (R), green (G) and blue (B) light emissions. More simply, yellow can be identified by R=50% G=50% B=0% reflections; orange by R=75% G=25% B=0% reflections; pink by R=50% G=0% B=0% reflections; but possible combinations are really infinite. Color sensors operate only on reflection ratios and are not influenced by light intensity, defined as 'brilliance 'or 'luminance'. There is a wide range of applications, ranging from quality and process controls, to automatic material handling for identification, orientation and selection of objects according to color.

Fiber Optic Sensors

Universal functions of through-beam and proximity sensors, as well as application functions ranging from contrast and luminescence to color detection, can be obtained using fiber optic sensors. The optical fibers can be thought of as cables that transport light and can be used to place the sensor's optics in small spaces, or to detect very small objects.

An optical fiber is composed of cylindrical glass (or a plastic core), surrounded by Teflon or Silicon coating. The difference between the core and the coating refraction indexes allows the light to be diffused inside the fiber in a guided manner. The coating is covered by a plastic or metal sheath, which has an exclusively mechanical protection function. Fibers with a glass core and metal sheath are suitable for very high temperature uses, or for particular mechanical requirements. Plastic fibers, offering great adaptability, are the most diffused in all

Sensors

applications. Plastic optic fibers have a standard 2.2mm external diameter and generally have a cylindrical threaded metal head on the end used for mechanical mounting. These fibers are usually 1 and 2 meters in length as reductions in performance become significant with lengths over 5 meters. Plastic optic fibers can be shortened using a special fiber-cutting tool, but, it can only be used a limited number of times. Cutting the fiber with a non-sharp or non-perpendicular blade will reduce operating distance. High temperature, extra-flexible or high efficiency plastic optic fibers are also available.

Laser Sensors A LASER (Light Amplification by Stimulated Emission of Radiation) is

PLCS

an electronic device, such as a diode, that converts an energy source into a very thin and concentrated light beam, suitable for detecting very small objects or to reach very long operating distances. With reference to the safety of laser radiation (according to the EN60825-1 European standard) class 1 requires that the laser device is safe under reasonable operating conditions and is not dangerous

reasonable operating conditions and is not dangerous for people in any situation; while class 2 states that the eye cannot be protected just by looking away or blinking, thus precautions must be adopted to avoid staring into the beam.

IMPORTANT: Always consider safety when installing a laser sensor of any kind. Make sure that the laser beam cannot inadvertently shine into the eyes of people passing by or working in the vicinity. See safety information on page 232.

Mounting

Mounting brackets and hardware are included with sensors, where applicable. Use the hardware for mounting, along with washers and spring washers or lock nuts. Do not overtighten hardware. Overtightening causes damage to the housing and will adversely affect the waterproof characteristics of the sensor.

Best results can be obtained when the sensor is mounted so that the object sensed is in the center of the beam, rather than when the object is located near the edges of the sensing window. In addition, the most reliable sensing occurs when the majority of the objects being sensed are well within the sensing range, rather than at the extreme near and far limits.

Wiring

Avoid running high-voltages or power lines in the same conduit with sensor signal lines. This prevents inaccurate results or damage from induced noise. Use a separate conduit when the influence of power lines or electromagnetic equipment may occur, particularly when the distance of the wiring is extended.

IMPORTANT: Connect the sensor cables and wires as noted in the individual Wiring sections. Failure to connect as shown in wiring diagrams will result in damage to the internal circuit.

When extending sensor cables and wires, make sure to use cables equal or superior to that recommended in the individual specifications sections.

When wiring terminals, be sure to prevent contact between adjoining terminals. When using ring or fork lug terminals, use the insulated sleeve style only. Each sensor terminal can accept only one ring or fork lug terminal.

Power Supply

Noise resistance characteristics are improved when a sensor is grounded to the 0V power terminal. If the 0V power terminal is not at ground potential, use a ceramic 0.01μ F capacitor which can withstand 250V AC minimum.

When using a switching power supply, be sure to ground the FG terminal to eliminate high-frequency noise. The power supply should include an insulating transformer, not an autotransformer.

The compact PS5R-A power supply is the perfect companion item for most IDEC sensors. This power supply is only 1.77" (45mm) wide, 3.15" (80mm) tall, and 2.76" (70mm) deep. Call an IDEC representative for more details.

Part Number	Output Ratings	
PS5R-A12	12V DC, 0.62A	
PS5R-A24	24V DC, 0.32A	

Miscellaneous

Strong magnetic fields may detract from the accuracy of the sensing measurements. Avoid mounting a sensor directly to machinery, since the housing is connected to the electronic circuit ground of the sensor. If it is necessary to mount a sensor on machinery, use the insulating plate and sleeve provided.

Sensors

Glossary

Attenuation: Reduction of beam intensity as a result of environmental factors such as dust, humidity, steam, etc.

Dark on: Output energized when light is not detected by the receiving element. For through-beam sensors, light from the projector is not detected by the receiver when an object is present. For reflected light sensors, light is not detected when it is not reflected from an object surface.

Diffuse-reflected light sensors: Sensors that detect all scattered and reflected light. Light reflected from nearby surfaces, as well as the intended object surface, is detected. Diffuse-reflected light sensors are often called "proximity switches," since they switch when any object is near. Also use to detect color contrast when colors reflect light intensity differently (green LED recommended for this application).

EEPROM: Acronym which stands for electronically erasable, programmable, read only memory.

Excess gain: Ratio of optical power available at a given projector-to-receiver range divided by the minimum optical power required to trigger the receiver.

Extraneous light: Incident light received by a sensor, not related to the presence or absence of an object being detected. Extraneous light is usually unwanted background light such as sunlight and incandescent lamps in close proximity.

 ΔE : The measurement of color difference as a three-variable function, located on an XYZ axis of light, hue, and chroma values.

Hysteresis: The lag in response shown by an object in reacting to changes in the forces affecting it . Operating point and release point at different levels. For solid state sensors, this is accomplished electrically. For mechanical switches, it results from storing potential energy before the transition occurs.

Light on: Output energized when light is detected by the receiving element. For through-beam sensors, light from the projector is detected by the receiver when an object is not present. For reflected light sensors, light is detected when it is reflected from an objects surface.

Linearity: The measure of the extent to which a certain response is directly proportional to the applied excitation.

NPN/PNP: Types of open collector transistors. NPN is a sink transistor; output on establishes negative potential difference. PNP is a source transistor; output on establishes positive potential difference.

Polarizing: Filtering out all reflected light except that which is projected in one plane only. Polarized retro-reflected light sensors detect the light from corner-cube type reflectors when an object is not present.

Reflected-light sensors: Sensors with the projector and receiver in one housing. Light is projected by the light source, and reflected light is received by the optical surface. Includes diffuse-reflected, retro-reflected, limited-reflected, and spot-reflected sensors.

Repeatability: Ability of a sensor to reproduce output readings consistently when the same value is applied consecutively, in the same direction, for a specified number of cycles, or for a specified time duration.

Resolution: Overall dimension of the smallest object which can be detected (when sensing the presence of an object) or smallest increment of distance which can be distinguished with reliable results (when sensing the position of an object).

Response time: Time elapsed between input and output. Total response time is the sum of object detection, amplifier response, and output response times.

Retro-reflective: This type of reflected light sensor uses a special reflector to return projected light when an object is not present. Sensor detects the presence of an object when the light is reflected differently.

Through-beam sensors: Sensors with a separate projector and receiver. The light source from the projector is detected by the receiver, except when an object is present.

Transient: Undesirable surge of current (many times larger than normal current) for a very short period, such as during the start-up of an inductive motor.
